Your favorite equations?

Your favorite equations?

- $a^2 + b^2 = c^2$
- $e^{i\pi} + 1 = 0$
- $\int_{\partial D} \omega = \int_D d\omega$
- ...

Your favorite equations?

- $a^2 + b^2 = c^2$
- $e^{i\pi} + 1 = 0$
- $\int_{\partial D} \omega = \int_D d\omega$
- ...

But, what is an **equation**?

Your favorite equations?

- $a^2 + b^2 = c^2$
- $e^{i\pi} + 1 = 0$
- $\int_{\partial D} \omega = \int_D d\omega$
- ...

But, what is an **equation**?

$A = B$ says A **is** equal to B , **how** they are equal depends on the *proof*.

Hopf fibration is a map defined by

$$H : \mathbb{S}^3 \subset \mathbb{C}^2 - \{0\} \rightarrow \mathbb{CP}^1 \cong \mathbb{S}^2, (z_1, z_2) \mapsto [z_1, z_2]$$

For any point $x \in \mathbb{S}^2$, preimage $H^{-1}(x)$ is a circle \mathbb{S}^1 .

Hopf fibration is a map defined by

$$H : \mathbb{S}^3 \subset \mathbb{C}^2 - \{0\} \rightarrow \mathbb{CP}^1 \cong \mathbb{S}^2, (z_1, z_2) \mapsto [z_1, z_2]$$

For any point $x \in \mathbb{S}^2$, preimage $H^{-1}(x)$ is a circle \mathbb{S}^1 . We can visualize this map by considering $H : \mathbb{R}^3 \cong \mathbb{S}^3 - \{\infty\} \rightarrow \mathbb{S}^2$:

To understand a space X , we use some homotopy invariants:

- $\pi_0 X \in \text{Set}$, how many "pieces" X has.

To understand a space X , we use some homotopy invariants:

- $\pi_0 X \in \text{Set}$, how many "pieces" X has.
- Chose a base point $x \in X$, Let $\text{Map}_*(\mathbb{S}^1, X) \in \text{Space}$ be the space of loops in X started from x .

To understand a space X , we use some homotopy invariants:

- $\pi_0 X \in \text{Set}$, how many "pieces" X has.
- Chose a base point $x \in X$, Let $\text{Map}_*(\mathbb{S}^1, X) \in \text{Space}$ be the space of loops in X started from x .
- $\pi_1(X, x) = \pi_0 \text{Map}_*(\mathbb{S}^1, X) \in \text{Group}$, how many loops in X up to deformation.

To understand a space X , we use some homotopy invariants:

- $\pi_0 X \in \text{Set}$, how many "pieces" X has.
- Chose a base point $x \in X$, Let $\text{Map}_*(\mathbb{S}^1, X) \in \text{Space}$ be the space of loops in X started from x .
- $\pi_1(X, x) = \pi_0 \text{Map}_*(\mathbb{S}^1, X) \in \text{Group}$, how many loops in X up to deformation.
- $i > 1, \pi_i(X, x) = \pi_0 \text{Map}_*(\mathbb{S}^i, X) \cong \pi_0 \text{Map}_*(\mathbb{S}^1, \text{Map}_*(\mathbb{S}^{i-1}, X)) \in \text{Abel}$

To understand a space X , we use some homotopy invariants:

- $\pi_0 X \in \text{Set}$, how many "pieces" X has.
- Chose a base point $x \in X$, Let $\text{Map}_*(\mathbb{S}^1, X) \in \text{Space}$ be the space of loops in X started from x .
- $\pi_1(X, x) = \pi_0 \text{Map}_*(\mathbb{S}^1, X) \in \text{Group}$, how many loops in X up to deformation.
- $i > 1, \pi_i(X, x) = \pi_0 \text{Map}_*(\mathbb{S}^i, X) \cong \pi_0 \text{Map}_*(\mathbb{S}^1, \text{Map}_*(\mathbb{S}^{i-1}, X)) \in \text{Abel}$

Let us study the cases $X = \mathbb{S}^n$.

- For $i < n$, $\pi_i(\mathbb{S}^n) = \{0\}$, where $0 : \mathbb{S}^i \rightarrow * \xrightarrow{\text{base}} \mathbb{S}^n$.

- For $i < n$, $\pi_i(\mathbb{S}^n) = \{0\}$, where $0 : \mathbb{S}^i \rightarrow * \xrightarrow{\text{base}} \mathbb{S}^n$.
- For $\pi_n(\mathbb{S}^n)$, we consider the space $\text{End}_*(\mathbb{S}^n) = \text{Map}_*(\mathbb{S}^n, \mathbb{S}^n)$.

- For $i < n$, $\pi_i(\mathbb{S}^n) = \{0\}$, where $0 : \mathbb{S}^i \rightarrow * \xrightarrow{\text{base}} \mathbb{S}^n$.
- For $\pi_n(\mathbb{S}^n)$, we consider the space $\text{End}_*(\mathbb{S}^n) = \text{Map}_*(\mathbb{S}^n, \mathbb{S}^n)$.

Let $f \in \text{End}_*(\mathbb{S}^n)$, take a small disk $D_\epsilon^n \subset \mathbb{S}^n$ away from the base point. Then the preimage $f^{-1}(D_\epsilon^n) \subset \mathbb{S}^n - \{*\} \cong \mathbb{R}^n$ is a disjoint union of disks for ϵ small enough. Notice that the disks in the union have orientations $+$ and $-$.

 deform

Homotopy groups of spheres

- For $i < n$, $\pi_i(\mathbb{S}^n) = \{0\}$, where $0 : \mathbb{S}^i \rightarrow * \xrightarrow{\text{base}} \mathbb{S}^n$.
- For $\pi_n(\mathbb{S}^n)$, we consider the space $\text{End}_*(\mathbb{S}^n) = \text{Map}_*(\mathbb{S}^n, \mathbb{S}^n)$.

Let $f \in \text{End}_*(\mathbb{S}^n)$, take a small disk $D_\epsilon^n \subset \mathbb{S}^n$ away from the base point. Then the preimage $f^{-1}(D_\epsilon^n) \subset \mathbb{S}^n - \{*\} \cong \mathbb{R}^n$ is a disjoint union of disks for ϵ small enough. Notice that the disks in the union have orientations $+$ and $-$.

- For $i < n$, $\pi_i(\mathbb{S}^n) = \{0\}$, where $0 : \mathbb{S}^i \rightarrow * \xrightarrow{\text{base}} \mathbb{S}^n$.
- For $\pi_n(\mathbb{S}^n)$, we consider the space $\text{End}_*(\mathbb{S}^n) = \text{Map}_*(\mathbb{S}^n, \mathbb{S}^n)$.

Let $f \in \text{End}_*(\mathbb{S}^n)$, take a small disk $D_\epsilon^n \subset \mathbb{S}^n$ away from the base point. Then the preimage $f^{-1}(D_\epsilon^n) \subset \mathbb{S}^n - \{*\} \cong \mathbb{R}^n$ is a disjoint union of disks for ϵ small enough. Notice that the disks in the union have orientations $+$ and $-$.

This gives an isomorphism to the configuration space of disks.

$$\text{End}_*(\mathbb{S}^n) \cong \text{Conf}(\mathbb{R}^n) = \bigcup_{j,k} \text{Emb}\left(\bigsqcup_j D_+^n \sqcup \bigsqcup_k D_-^n, \mathbb{R}^n\right)$$

Therefore, $\pi_0 \text{End}_*(\mathbb{S}^n) \cong \mathbb{Z}$, $(j, k) \mapsto j - k$

- For $i > n$, $\pi_i(\mathbb{S}^n) = ?$

Higher homotopy groups of spheres

- For $i > n$, $\pi_i(\mathbb{S}^n) = ?$
- For $i > 1$, $\pi_i(\mathbb{S}^1) = \{0\}$.

- For $i > n$, $\pi_i(\mathbb{S}^n) = ?$
- For $i > 1$, $\pi_i(\mathbb{S}^1) = \{0\}$.
- But $\pi_3(\mathbb{S}^2) = \pi_0 \text{Map}_*(\mathbb{S}^3, \mathbb{S}^2) \ni H$, and $H \not\approx 0$, i.e. H can not deform to 0

How to see that?

- For $i > n$, $\pi_i(\mathbb{S}^n) = ?$
- For $i > 1$, $\pi_i(\mathbb{S}^1) = \{0\}$.
- But $\pi_3(\mathbb{S}^2) = \pi_0 \text{Map}_*(\mathbb{S}^3, \mathbb{S}^2) \ni H$, and $H \not\approx 0$, i.e. H can not deform to 0

How to see that?

$$\text{Map}_*(\mathbb{S}^3, \mathbb{S}^2) \cong \text{Map}_*(\mathbb{S}^1, \text{End}_*(\mathbb{S}^n)) \rightarrow \text{Map}_*([0, 1], \text{End}_*(\mathbb{S}^n))$$

Then H corresponds to a path (deformation or homotopy) from $0 \in \text{End}_*(\mathbb{S}^n)$ to 0 itself.

Visualize H as deformation

I made an animation to visualize this deformation.

Visualize H as deformation

I made an animation to visualize this deformation.

We can also visualize it as a movement in the configuration space.
We will show it in the end.

We can define natural number \mathbb{N} as isomorphic classes of finite sets.

$$\text{FinSet}_{/\cong} \xrightarrow{|\cdot|} \mathbb{N}, |X \sqcup Y| = |X| + |Y|$$

How to define integral number \mathbb{Z} with finite sets?

We can define natural number \mathbb{N} as isomorphic classes of finite sets.

$$\text{FinSet}_{/\cong} \xrightarrow{|\cdot|} \mathbb{N}, |X \sqcup Y| = |X| + |Y|$$

How to define integral number \mathbb{Z} with finite sets?

We use the **Grothendieck group** $K_0(\text{FinSet})$

$$K_0(\text{FinSet}) = \{(X, Y) \in (\text{FinSet}_{/\cong})^2\} / \{(X \sqcup Z, Y \sqcup Z) \sim (X, Y)\}$$

We can think we formally define " $X - Y$ " in this way.

We can define natural number \mathbb{N} as isomorphic classes of finite sets.

$$\text{FinSet}_{/\cong} \xrightarrow{|\cdot|} \mathbb{N}, |X \sqcup Y| = |X| + |Y|$$

How to define integral number \mathbb{Z} with finite sets?

We use the **Grothendieck group** $K_0(\text{FinSet})$

$$K_0(\text{FinSet}) = \{(X, Y) \in (\text{FinSet}_{/\cong})^2\} / \{(X \sqcup Z, Y \sqcup Z) \sim (X, Y)\}$$

We can think we formally define " $X - Y$ " in this way.

But what is $K_i(\text{FinSet})$ for $i > 0$?

Space of "finite sets"

Instead of thinking the set of "finite sets", we now consider the space of them $F = \text{FinSet}^{\cong}$: every point $x \in F$ corresponds to a finite set, and a path between two points corresponds to an isomorphism $f : x \rightarrow y$ of two finite sets.

Space of "finite sets"

Instead of thinking the set of "finite sets", we now consider the space of them $F = \text{FinSet}^{\cong}$: every point $x \in F$ corresponds to a finite set, and a path between two points corresponds to an isomorphism $f : x \rightarrow y$ of two finite sets.

Space of "finite sets"

Instead of thinking the set of "finite sets", we now consider the space of them $F = \text{FinSet}^{\cong}$: every point $x \in F$ corresponds to a finite set, and a path between two points corresponds to an isomorphism $f : x \rightarrow y$ of two finite sets.

- $\pi_0(F) = \text{FinSet}_{/\cong} \cong \mathbb{N}$.
- $\pi_1(F, x) = S_{|x|}$ the permutation group.
- $\pi_i(F, x) = \{0\}$ for $i > 0$ (one can never deform an isomorphism of set to another).

K-space (spectrum) of "finite sets"

We want to add "negative" to F . We can consider the space $K(F)$ of (ordered) finite sets, whose elements are marked by $+$ or $-$, and we also want to identify the sets with same "value" $\|X\| = |X_+| - |X_-|$, and these identifications will be the paths.

K-space (spectrum) of "finite sets"

We want to add "negative" to F . We can consider the space $K(F)$ of (ordered) finite sets, whose elements are marked by $+$ or $-$, and we also want to identify the sets with same "value" $\|X\| = |X_+| - |X_-|$, and these identifications will be the paths.

K-groups of "finite sets"

Let $K_i(\text{FinSet}) = \pi_i K(F)$ to be the higher K-groups, we have the following observations:

K-groups of "finite sets"

Let $K_i(\text{FinSet}) = \pi_i K(F)$ to be the higher K-groups, we have the following observations:

- $\pi_0 K(F) = \mathbb{Z}$, by $x \mapsto \|x\|$. This coincides with $K_0(\text{FinSet})$.

Let $K_i(\text{FinSet}) = \pi_i K(F)$ to be the higher K-groups, we have the following observations:

- $\pi_0 K(F) = \mathbb{Z}$, by $x \mapsto \|x\|$. This coincides with $K_0(\text{FinSet})$.
- We can construct a loop $h \in \pi_1 K(F)$ by using identifications

$$h : \emptyset \sim \{+, -\} \sim \{-, +\} \sim \emptyset$$

Let $K_i(\text{FinSet}) = \pi_i K(F)$ to be the higher K-groups, we have the following observations:

- $\pi_0 K(F) = \mathbb{Z}$, by $x \mapsto \|x\|$. This coincides with $K_0(\text{FinSet})$.
- We can construct a loop $h \in \pi_1 K(F)$ by using identifications

$$h : \emptyset \sim \{+, -\} \sim \{-, +\} \sim \emptyset$$

- In fact $\pi_1 K(F) = S_n^{ab} = \mathbb{Z}/2$ with h as the generator. That is to say, h is a non-trivial identification.

K-groups of "finite sets"

Let $K_i(\text{FinSet}) = \pi_i K(F)$ to be the higher K-groups, we have the following observations:

- $\pi_0 K(F) = \mathbb{Z}$, by $x \mapsto \|x\|$. This coincides with $K_0(\text{FinSet})$.
- We can construct a loop $h \in \pi_1 K(F)$ by using identifications

$$h : \emptyset \sim \{+, -\} \sim \{-, +\} \sim \emptyset$$

- In fact $\pi_1 K(F) = S_n^{ab} = \mathbb{Z}/2$ with h as the generator. That is to say, h is a non-trivial identification.

Answer

We can prove $0 = 0$ non-trivially with $h : 0 = 1 - 1 = -1 + 1 = 0!$

What's more?

But what is the connection between these two topics?

But what is the connection between these two topics?

- In fact, $K_i(\text{FinSet}) \cong \lim_{n \rightarrow \infty} \pi_{i+n}(\mathbb{S}^n) = \pi_i^s(\mathbb{S})$.

But what is the connection between these two topics?

- In fact, $K_i(\text{FinSet}) \cong \lim_{n \rightarrow \infty} \pi_{i+n}(\mathbb{S}^n) = \pi_i^s(\mathbb{S})$.
- So, $K(F)$ can be seen as $\text{Conf}(\mathbb{R}^\infty)$, and both the Hopf map H and h can be represented as movements within it.

But what is the connection between these two topics?

- In fact, $K_i(\text{FinSet}) \cong \lim_{n \rightarrow \infty} \pi_{i+n}(\mathbb{S}^n) = \pi_i^s(\mathbb{S})$.
- So, $K(F)$ can be seen as $\text{Conf}(\mathbb{R}^\infty)$, and both the Hopf map H and h can be represented as movements within it.

And they are the same!

What about cobordism?

If we put the movement in 3D space:

What about cobordism?

If we put the movement in 3D space:

This provides a framed circle, meaning an embedding $\mathbb{S}^1 \hookrightarrow \mathbb{R}^n$ with a trivialization of the normal bundle. We denote Ω_i^{fr} as the cobordism classes of i -dimensional framed manifolds.

What about cobordism?

If we put the movement in 3D space:

This provides a framed circle, meaning an embedding $\mathbb{S}^1 \hookrightarrow \mathbb{R}^n$ with a trivialization of the normal bundle. We denote Ω_i^{fr} as the cobordism classes of i -dimensional framed manifolds. And we have:

$$\Omega_i^{fr} \cong \pi_i^s(\mathbb{S})$$

Therefore, this framed circle is non-trivial and is the generator of Ω_1^{fr} .

Thank you, hope you have got the brain upgrades!

$$S^3 \sim \mathbb{C}^2 \setminus \{0\} \rightarrow \mathbb{CP}^1 \sim S^2$$

$$\pi_4(S^3) \cong \mathbb{Z}/2\mathbb{Z}$$

$$\pi_1^s(S) \cong \Omega_1^{\text{fr}}$$

$$K_1(\mathbb{F}_1) \cong S_\infty^{\text{ab}}$$

$$0=1-1=1+1=0$$
